Multi-Lambda Catalyst Test System Verifies Catalyst Performance

EmeraChem LLC has developed the all-new Multi-Lambda Catalyst Test System to add more life to your catalyst and peace of mind to your business. Don't risk being fooled by improper testing methods. The EmeraChem system uses testing protocols that simulate real engine applications and measure your catalyst's ability to destroy pollutants as defined in your permit. This allows your operations personnel to verify the performance of washed catalyst prior to re-installation. The MLCTS is available for all catalyst sizes, shapes, permit levels and manufacturers.

The difference is in the test methods. The Multi-Lambda Catalyst Test System can directly measure CO oxidation in a lean gas environment, and directly measure NO reduction in a rich gas environment. That's what you expect your catalyst to do for you. Our system offers clear, correct information with real-time results. Its relevant test data, along with applicable engine and site data will allow you to make better decisions about your catalyst.

Schedule a visit with one of our regional Catalyst Service Centers near you to get the most from your catalyst dollars, extend your catalyst life and get the onsite technical support to achieve the lowest emissions on your equipment. Get back to your core business with the confidence you will be in compliance and leave the emissions management to our dealer network. That's the comfort of "life beyond compliance."
